Dairy-Herd-Improvement-Association Letter
May 1955

ARS-52-7
(Vol. 31, No. 5)

REPORTING ALL 718 RECORDS

The DHIA rules covering reporting of records on 718 cards should be followed by all supervisors. They are:

DHIA supervisors shall report every lactation record, complete or incomplete up to 305 days, regardless of the length of the lactation or how the record ended, ie., by drying off, died, sold, etc. Short time incomplete records for any number of days shall be reported as well as complete lactation records.

Sire and dam identification information shall be reported on every 718 when possible, but 718 reports shall be made on every cow even though sire and dam information cannot be obtained. Records of cows without sire and dam information are being used more and more (as dams) to prove AB sires.

VARYING THE DHIA TESTING DAY

The ADSA rules governing DHIA testing provide that the centering-day method be used to calculate DHIA records. Most States use the centering-day method. All States have indicated they will be using this method by the end of the year.

Equally important to using the centering-day method when calculating records is the regularity with which individual herds are tested. Unless the centering-day method is used with the actual testing day varying not more than 3 days before or 3 days after the established centering day for the herd, the record is not calculated according to the DHIA rules. Also, to conform to the DHIA rules the supervisor must vary the actual testing day for each herd within the 3-day limit or within a 7-day period (3 days before, plus testing day plus 3 days after) and not test a herd on exactly the same day month after month.

Supervisors are expected to conduct their testing work according to these rules.

CORRECTION: In the March DHIA Letter, page 1, New York with 380,395 cows bred in 1954 was omitted from the list of States in which more than 40,000 cows were bred artificially during 1954.

DHIA PROVED-SIRE RECORDS TABULATED IN APRIL 1955

Following is a list of 664 sires whose records were tabulated or retabulated by the Dairy Husbandry Research Branch in April 1955. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., *12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., *May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
